Normal Mode Rejection and Antialiasing

- An on chip digital low pass filter offers excellent rejection up to the internal modulator sampling rate.
- At multiples of the internal modulator sample rate, unwanted input perturbations are folded back to DC with little attenuation (aliasing).

This graph shows the normal mode rejection for an internal oscillator. The y-axis is 'NORMAL MODE REJECTION (dB)' ranging from 0 to -140. The x-axis is 'DIFFERENTIAL INPUT SIGNAL FREQUENCY (Hz)' ranging from 0 to 240. The plot shows a series of peaks and valleys, with the rejection generally increasing in magnitude as frequency increases, reaching approximately -100 dB at 240 Hz.

Normal Mode Rejection (Internal Oscillator)

This graph shows the normal mode rejection for an external oscillator at 90 kHz. The y-axis is 'NORMAL MODE REJECTION (dB)' ranging from 0 to -140. The x-axis is 'DIFFERENTIAL INPUT SIGNAL FREQUENCY (Hz)' ranging from 0 to 10. The plot shows a series of peaks and valleys, with the rejection generally increasing in magnitude as frequency increases, reaching approximately -100 dB at 10 Hz.

Normal Mode Rejection (External Oscillator @ 90kHz)
